

EcoSmoke, neutralises smoke odour quickly and naturally.
EcoSmoke is an odour eliminator especially designed for the removal of fire and smoke odours.

EcoSmoke is sprayed onto the source of the odour.
The enzymes decompose the smoke and / or soot odour molecules.
EcoSmoke responds quickly and efficiently to break down the pungent smell of fire and smoke within a few hours, to completely neutralise the air, and makes your home or office habitable again.

Experience in the past years has shown that EcoSmoke is also suitable for oil damage and the removal of odours and musty smells in flooded confinements such as basements.

Depending on the intensity of the smell, only one or a few applications may be necessary.

Usage Instructions:

In situations where it is important that the EcoSmoke droplets penetrate deep into some materials, such as ceilings, cavity walls, furniture, polyether foam, etc., and also that the increased relative humidity is not desired, it is recommended to choose a nebulizer that emits an as fine as possible mist.

In other situations a portable misting fogger is sufficient (as the nebulizer Nebulo).

Composition:

EcoSmoke is composed of a number of different organic enzymes, through which a broad spectrum of components of odour can be effectively dealt with and neutralised.

Applications:

Fire & soot damage, smoke odour elimination, oil damage, remove odours and musty smells in flooded basements.
